Sounds like good work done. . -gopo-ep1-6 Q:

Spherical harmonics basis I need a basis of spherical harmonics on a sphere. From what I've read, we have

$$\frac{\mathbf{e}^{\mathbf{m}}}{\sqrt{2\pi}^3} Y_{\mathbf{m}}(\theta, \phi)$$

where $\mathbf{e}^{\mathbf{m}}$ is a vector, θ is an angle in the radial and ϕ is an angle in the azimuthal directions (two angles). This implies that $Y_{\mathbf{m}}(\theta, \phi)$ is a vector, i.e., two angles. I know it has six components, and I'm having a bit of trouble with this point. A first try could be to expand the vector $\mathbf{e}^{\mathbf{m}}$ in the spherical harmonics

$$\mathbf{e}^{\mathbf{m}} = \sum_{\mathbf{n}} c_{\mathbf{n}} \mathbf{Y}_{\mathbf{n}}$$

and then compute

$$\frac{\mathbf{e}^{\mathbf{m}}}{\sqrt{2\pi}^3} Y_{\mathbf{m}}(\theta, \phi) = \frac{1}{\sqrt{2\pi}^3} \sum_{\mathbf{n}} c_{\mathbf{n}} \mathbf{Y}_{\mathbf{n}}(\theta, \phi)$$

Then $\mathbf{e}^{\mathbf{n}}$ and $\mathbf{e}^{\mathbf{m}}$ are equivalent (I'm not sure if this is true, but it is fine for this problem). Now, if I compute $Y_{\mathbf{n}}(\theta, \phi)$ with the above expansion, do I get the right set of basis functions for spherical harmonics? If not, what are the

equations to generate this set? Edit: I'm not sure about this, so I'll ask a second question, just to make sure: the above is just an expansion in spherical harmonics, right? A: The basic spherical

SOV. WVOS, Radio Station Vincent Ressel, WVOS, “Wind River”, 25 August 1952 WVOS, Radio Station, is located at 2410 North Greenwich Street in Grand Rapids, Michigan. The transmitter site is at the top of the radio tower. The antenna is an FM directional Yagi with 5 radials. WVOS, Radio Station, is an AM sister station of WMRD, Radio Station, and has a 100,000 watt signal. This recording, “Wind River,” was recorded on 7 August 1952. The high frequency of the audio in this recording has been magnified, by the magnifying button to the right of the YouTube window, to better hear the sound quality. The recording only has a 1.7 second clip, because there is a slight chirp in the beginning. Because this recording is 2 ½ minutes long, the opening and closing shows of the recording and the credit roll, have been removed. Paul Poteet, WVOS, “Wind River,” 7 August 1952 Vincent Ressel, WVOS, “Wind River,” 25 August 1952

Green Bay Packers team that lost nine of its first 10 games is changing for the better. The biggest reason is the Packers have added dynamic tight ends. GREEN BAY, Wis. — The offseason puzzle pieces were slowly coming together. First, the Packers signed Martellus Bennett, now with a \$10 million deal, and started talking about the best quarterback in the division in Jimmy Garoppolo. And, then, in early June, the Packers signed Martellus Bennett. “You watch the film, you see that he’s a difference-maker, and then going out and playing with him in the preseason and learning from him, you know, it’s different — you saw the ripple effect on this offense,” Aaron Rodgers said. “You saw the effect he had on the f678ea9f9e
